Detection

1-lane-bridge in traffic

In Software:

- passive resource limits the concurrency
- e.g. synchronization points, database locks
- may cause congestion

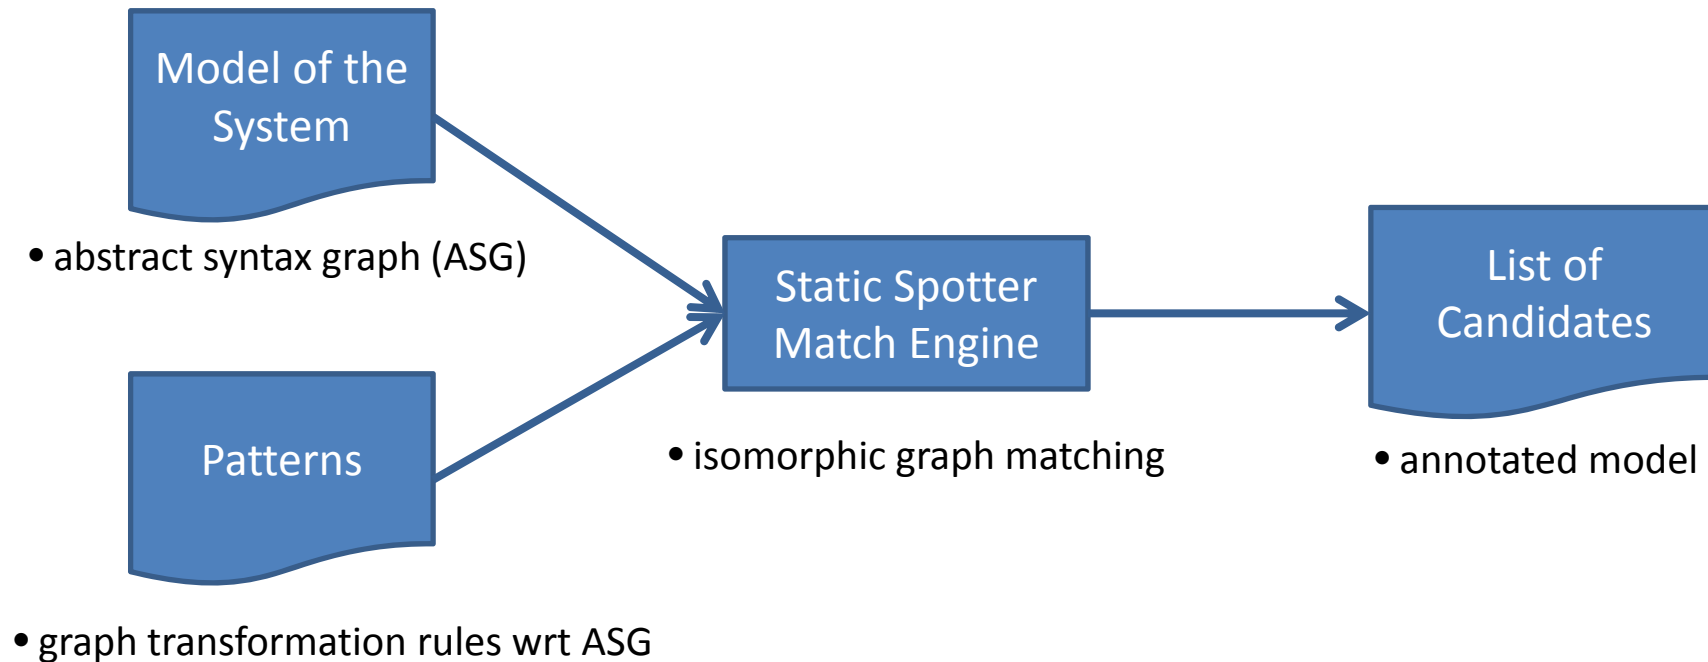

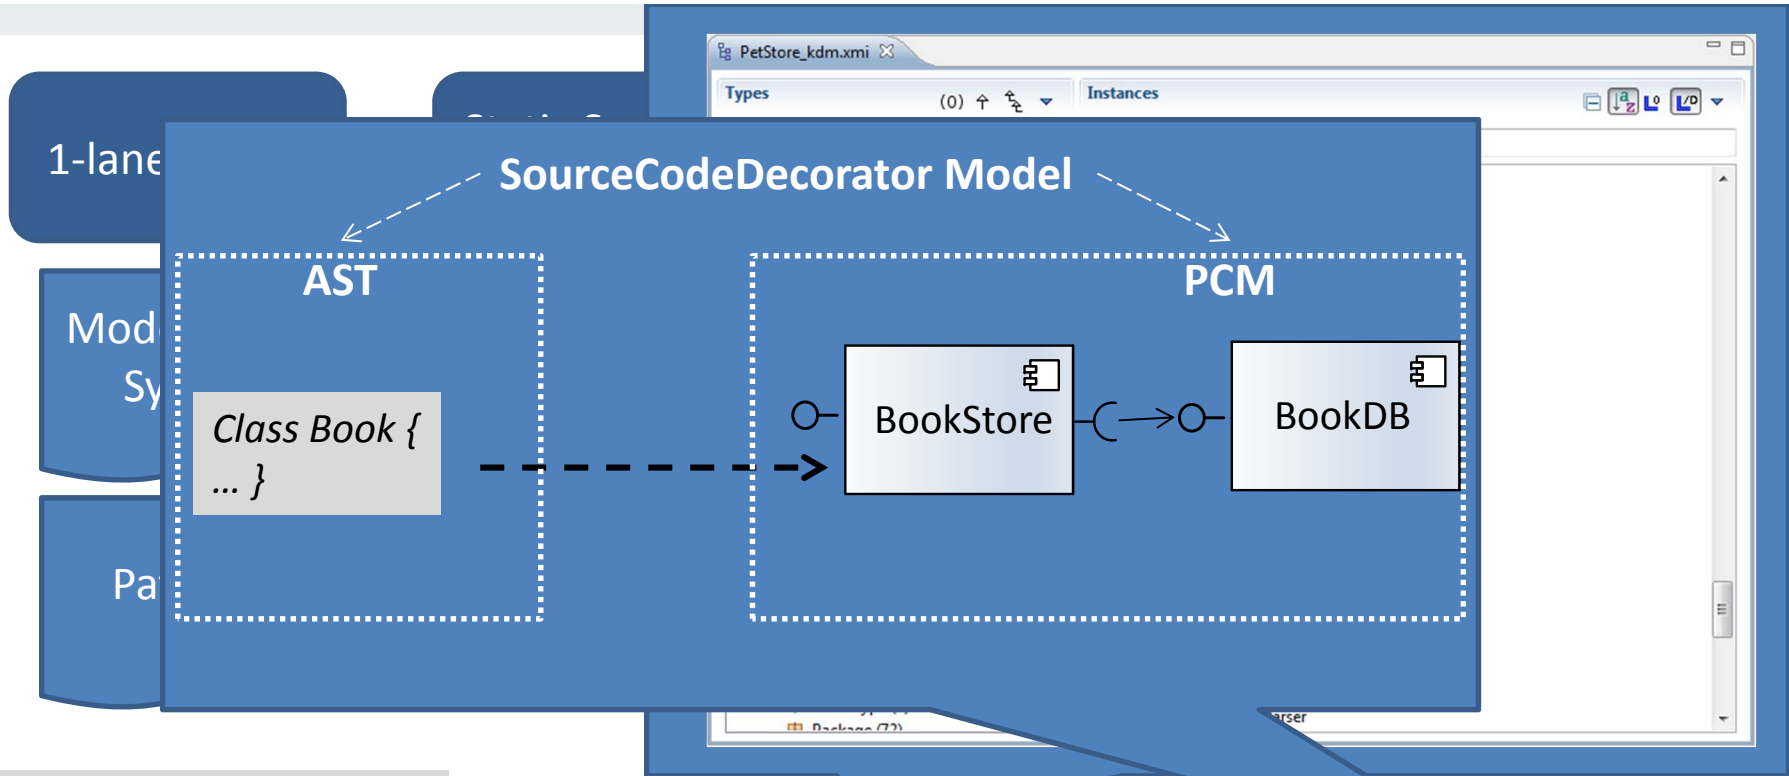

1-lane-bridge

Static Spotter:
Overview

Static Spotter:
Specification

Static Spotter:
Detection

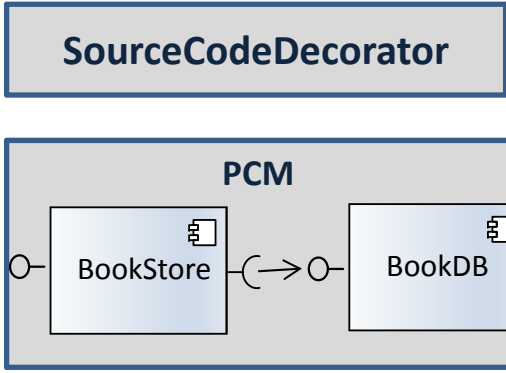

```
class Book {
  synchronized void modify() {
    ...}
  ...}
}
```

```
>[ClassUnit] Book
>/eContainer
>isAbstract = false
>atribute[4]
>codeElement[11]
  >[MethodUnit] modify
    >return = void
    >synchronized=true
  ....
```

How to detect candidates for 1-lane-bridge?

e.g. **synchronization spots**

- synchronized method
- synchronized block

Graphical DSL for patterns specification

1-lane-bridge

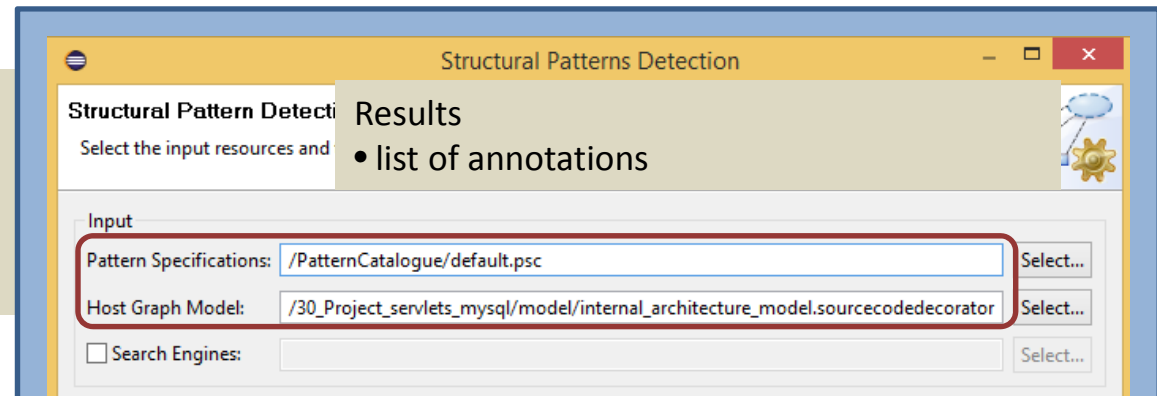

Static Spotter:
Overview

Static Spotter:
Specification

Static Spotter:
Detection

Graph matching algorithm

- single root object
- the graph transformation rules are leveled
- combined a bottom-up strategy and a top-down strategy

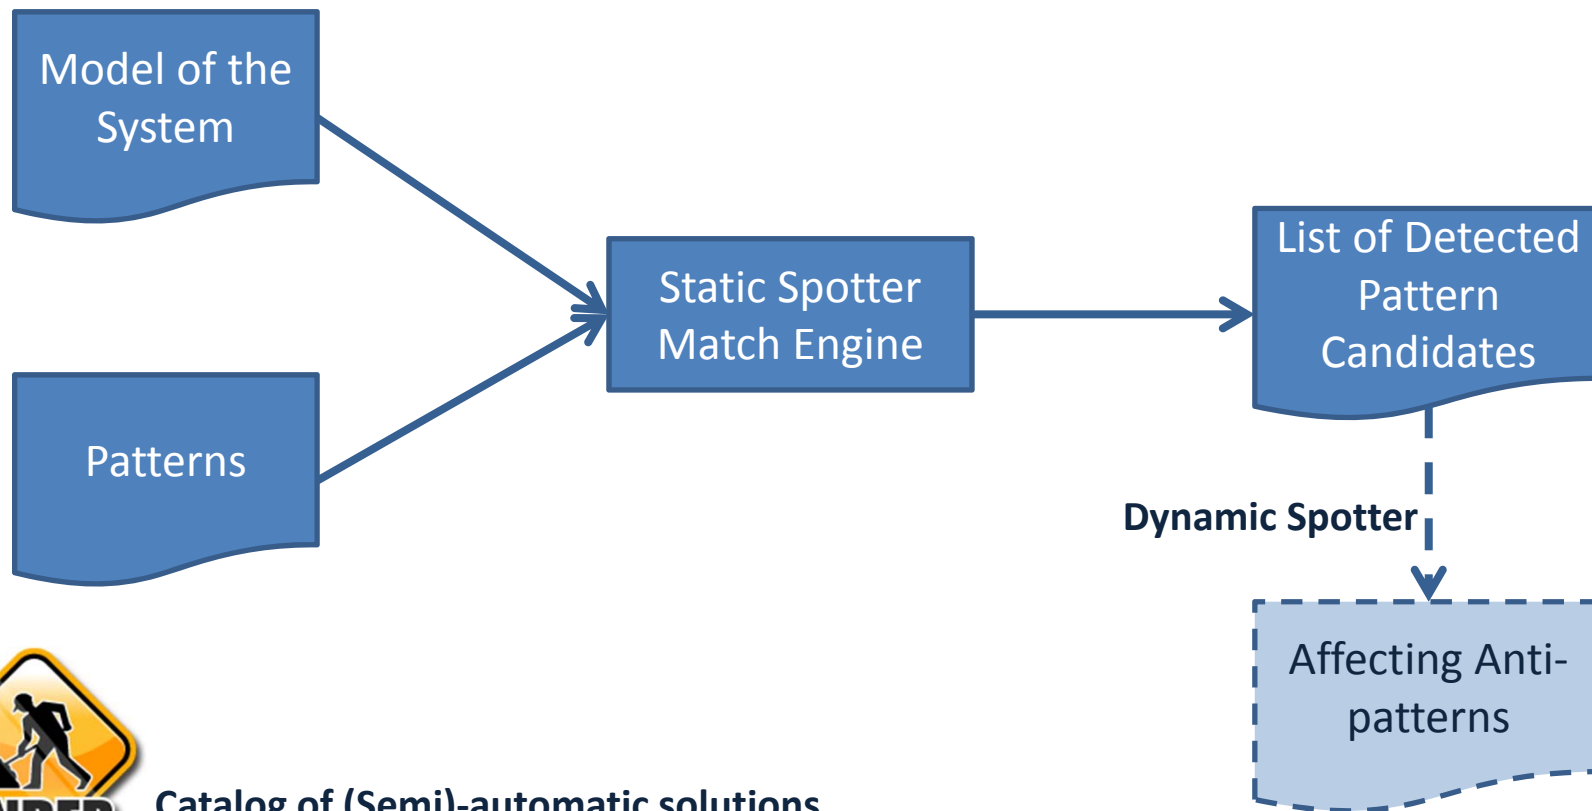

Annotation	Rating	Annotated Elements
AcquireReleasePair (2 annotations)		
FindMethods (209 annotations)		
FindPrimitiveComponents (72 annotations)		
SynchronizedMethod (5 annotations)		
SynchronizedMethod	100.00%	synchronizedMethods=org.eclipse.gmt.modisco.java.emf.impl.MethodDeclarationImpl@2a94d8dd (name: unlock, proxy: false) (extraArrayDimensions: 0)
Antecedent Annotations		
[synchronizedMethods] org.eclipse.gmt.m		
SynchronizedMethod	100.00%	synchronizedMethods=org.eclipse.gmt.modisco.java.emf.impl.MethodDeclarationImpl@5a7666 (name: interaction, proxy: false) (extraArrayDimensions: 0)
SynchronizedMethod	100.00%	synchronizedMethods=org.eclipse.gmt.modisco.java.emf.impl.MethodDeclarationImpl@4d7e1e5c (name: clear, proxy: false) (extraArrayDimensions: 0)
SynchronizedMethod	100.00%	synchronizedMethods=org.eclipse.gmt.modisco.java.emf.impl.MethodDeclarationImpl@54f6f726 (name: lock, proxy: false) (extraArrayDimensions: 0)
SynchronizedMethod	100.00%	synchronizedMethods=org.eclipse.gmt.modisco.java.emf.impl.MethodDeclarationImpl@79c4ba8e (name: transition, proxy: false) (extraArrayDimensions: 0)

Processed 100% - 562 of 562 required analysis steps.

Static Spotter: Pattern Matching

Rule leveling:

A rule depending only on objects in the initial ASG gets number 1. A rule depending on other rules, i.e., whose definition includes annotations created by other rules, gets a higher number consistent with the natural topological order of the rules. Rules included in cycles concerning their dependencies get the same level number and are marked as recursive.

Bottom-up then top-down strategy:

After parsing the source code to create the ASG, the analysis starts in bottom-up mode. Initially, all ASG objects schedule level 1 rules, i.e., those depending on ASG objects only.

When a rule that depends on other rules cannot be applied in bottom-up mode, the algorithm switches to top-down mode, which uses a separate *top-down priority queue*. *The top-down strategy* tries to make the other rules create the missing annotations based on currently available information.

The rule/context pair at the front of the top-down mode queue is not dequeued if the rule involved schedules other lower-level rules. Instead, pairs added to the top-down queue are queued in *ascending order of their level number*. *This means that the higherlevel rule will be reconsidered after the lower-level rules on which it depends (if these succeed)*. Using a priority queue rather than a stack means that the top-down algorithm goes as far down the ASG as quickly as possible.

The algorithm runs in top-down mode until the top-down queue is empty or a rule in the queue fails with no alternative contexts left to explore.

The overall analysis finishes when the bottom-up queue is empty. In this case the algorithm has analysed all ASG objects and created annotations on the objects for all rules that could be applied.
