

# Mapping Data Flow Models to the Palladio Component Model

Stephan Seifermann, Dominik Werle, Mazen Ebada 06.11.2019 - Symposium on Software Performance 2019, Würzburg

SOFTWARE DESIGN AND QUALITY GROUP,
INSTITUTE FOR PROGRAM STRUCTURES AND DATA ORGANIZATION, KIT DEPARTMENT OF INFORMATICS

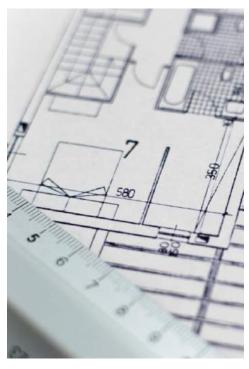

### **Motivation**

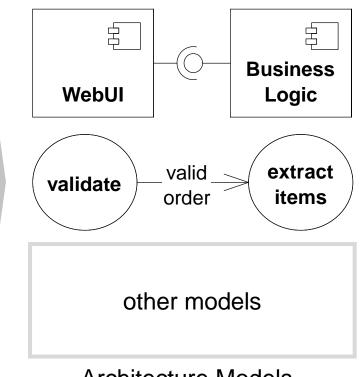

Software Architects

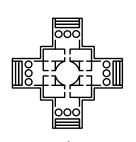

**Sketched Architecture** 

Will quality goals be achieved?

**Architecture Models** 

Are all models consistent?

other tools

Analyses

Are results compatible?

**Motivation** 

State of the Art >> Foundations >>

Running Example

Mappings >>

Process

# **High Level Challenges and Goals**

# Challenges of multiple models and analyses

- Consistency between separated models not trivial
- Additional maintenance effort for multiple models
- Analysis results have to be about same version.

# Benefit of using dedicated models and analyses

- Modeling approach tailored to quality analysis
- Established analyses provide good predictions

**Motivation** State of the Art Foundations

Mapping Data Flow Models to the Palladio Component Model

Mappings >>

**Process** 

# **Topics in this Talk**

#### **Covered Models**

- Data Flow Diagrams (DFDs) [DeMarco79]
- Palladio Component Model (PCM) [Reussner16]

### Covered Challenges

- Consistency: Mapping rules between DFDs and PCM
- Maintenance Effort: Idea for automated PCM stub generation

**Motivation** 

>> State of the Art >> Foundations >> Running Example >> Mappings >>

Process

### State of the Art

#### Relation Data Flow and Control Flow Diagrams

Mapping DFD to object-oriented design [Alabiso88]

> handling of ambiguities and design space not clear

Mapping DFD to fine-grained behavior [LarsenPlatToetenel94]

no realistic DFDs (1:1 mapping of inputs to outputs)

#### Resolving ambiguities

 Control flow nodes in DFDs [WardMellor86]

> breaks separation between requirements and design

Relation inputs and outputs [TsePong89][BrunzaWeide93]

> Does not match required level of abstraction

Motivation

> State of the Art > Foundations > Running Example > Mappings >

Process

### **Foundations**

#### **Data Flow Diagrams**

- Defined by DeMarco
- Sources, sinks, processors, files, data flows

#### **Data Mapping Extension**

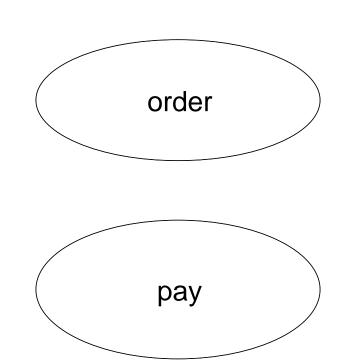

- Mapping of input data to output data [BrunzaWeide93]
- E: Set of all entities
- D: Set of all data
- $(e, D_{in}, D_{out})$ : Mapping with  $e \in E \land D_{in}, D_{out} \in D$

### Conclusion

#### Summary

- Motivation: DFDs and PCM instances tailored for different quality analyses
- Approach: Mappings from DFDs to PCM are possible but not trivial
- Customization: Considering design decisions necessary for realistic architectures

#### **Envisioned Benefit**

- Use best fitting models and analyses for quality prediction
- Lower effort for using both models together

#### **Future Work**

- Identify further call patterns and complete mappings
- Define set of selectable design decisions
- Realize automated transformation to apply mappings
